PROJECT REPORT

on

Human Resources Employee Satisfaction Survey

Analysis of survey results and recommendations for improvement

Submitted by

Jahnvi Singh

UID: 26BCD10396

Department: BCA in Data Science

Tools used: Microsoft Word, Excel and PowerPoint

Acknowledgement

I would like to thank my teachers and the department for giving me the chance to work on this project. Doing it helped me understand how a simple set of survey responses can be turned into useful information with the help of Excel. I also want to thank my family and friends, who helped me with ideas and encouraged me whenever I got stuck while preparing the data and the charts.

This report explains the work I did step by step, from collecting the survey data to analysing it and finally writing down what I think the company should do to improve.

1. Introduction

Every company depends on its employees. If the people working there are unhappy, it usually shows up sooner or later in the quality of work, in delays, and in good people leaving for another job. Because of this, many organisations run an employee satisfaction survey from time to time. The idea is simple. You ask the employees how they feel about different parts of their job, and then you look at the answers to find out what is going well and what is not.

In this project I took the role of someone working in the Human Resources (HR) department. I was given the responses of 30 employees from five departments: IT, HR, Marketing, Sales and Finance. Each employee rated five things on a scale of 1 to 5, where 1 is the lowest and 5 is the highest. These were salary satisfaction, work-life balance, management support, career growth and recognition. Each employee also answered a yes or no question about whether they would recommend the company to other people.

My job was to study these answers, find the main patterns, and suggest practical steps that the management can take to improve employee morale. I used all three Microsoft Office tools for this. Excel was used for the calculations, pivot table and charts, Word for this written report, and PowerPoint for a presentation to the management.

2. Objectives of the Project

The main objective is to analyse the results of the employee satisfaction survey and give recommendations for improvement. To reach this, I set the following smaller goals:

- To collect and arrange the survey responses of all 30 employees in one Excel sheet.
- To calculate the average score of each satisfaction factor and see which one is the strongest and which is the weakest.
- To compare the five departments with each other using a pivot table.
- To find out how many employees would recommend the company and how many would not.
- To show the results with clear charts so that anyone can understand them quickly.
- To suggest realistic and actionable steps for improving morale.

3. Survey Methodology

3.1 Type of survey

The survey was a quantitative one. That means most of the questions were answered with numbers instead of long written answers, which makes it much easier to calculate averages and compare groups. Employees were asked to rate each statement on a five point scale.

3.2 Rating scale

The same scale was used for all five satisfaction factors so that the results can be compared fairly:

Rating	Meaning
1	Very dissatisfied
2	Dissatisfied
3	Neutral
4	Satisfied
5	Very satisfied

Table 1: Rating scale used in the survey

3.3 Information collected from each employee

For every employee the following details were recorded in the Employee Data sheet:

- Employee ID (EMP001 to EMP030), department, job role and age group.
- Ratings for salary satisfaction, work-life balance, management support, career growth and recognition.
- Whether the employee would recommend the company to others (Yes or No).

Employee names were not used, only IDs, so that the responses stay anonymous. This is important in a real survey because people answer more honestly when they know nobody can point at them.

3.4 Sample size

A total of 30 employees took part. The number of employees from each department is shown below.

Department	Employees
IT	7
HR	5
Marketing	5
Sales	9
Finance	4
Total	30

Table 2: Number of respondents from each department

Sales has the largest group with 9 employees, while Finance has the smallest with only 4. I keep this in mind later, because an average of 4 people can change a lot if just one person gives a very different rating.

4. Data Preparation and Tools Used

4.1 Excel workbook

I made one Excel workbook with four sheets. Each sheet has its own purpose:

- **Employee Data:** the raw survey responses of all 30 employees, formatted as a table with filters on every column.

- **Employee satisfaction:** a summary sheet with the total number of employees, the average of each factor, and the count of employees who would and would not recommend the company.
- **Pivot Table:** a pivot table with departments in the rows, which shows the average of every factor for each department along with the employee count.
- **Charts:** charts made from the summary sheet, which are a column chart for the satisfaction factors and a pie chart for the company recommendation.

4.2 Formulas and functions

The summary sheet was built using basic Excel functions. COUNTA was used to count the employees, AVERAGE to find the mean score of each factor, and COUNTIF to count how many people answered Yes or No. The pivot table was made from the Insert menu and gives the department-wise averages automatically, so I did not need to calculate each department by hand.

4.3 Cleaning the data

Before doing any analysis I checked the data for mistakes. I found that the Yes answers were typed in two ways, "Yes" and "yes", in a few rows. Excel counts them as the same, but it is still better to keep them consistent, so I corrected them. I also corrected spelling mistakes in the labels of the summary sheet. After this I checked that the numbers add up: 24 Yes plus 6 No gives 30, which matches the number of employees.

4.4 Why these tools

Excel is a good choice for this kind of task because it can handle the calculations, the grouping and the charts in one place. Word is better for a detailed written explanation, and PowerPoint is useful when the results have to be presented quickly to managers who may not have time to read a full report.

5. Overall Survey Results

The table below shows the overall average of each factor, taken across all 30 employees.

Factor	Average score	Level
Salary Satisfaction	4.07	Good
Work-Life Balance	4.07	Good
Management Support	4.10	Good
Career Growth	4.03	Good
Recognition	3.83	Fair (lowest)

Table 3: Average score of each satisfaction factor

At first look the results are positive. All five factors have an average above 3.8 out of 5, and four of them are above 4. This tells me that most employees are at least satisfied with their jobs. Management support has the highest average (4.10), followed by salary satisfaction and work-life balance, which are both 4.07.

Chart 1: Employee Satisfaction Factors (from my Excel sheet)

Chart 1 shows the first column as Total Employee, which is 30, so it is much taller than the other bars. The other five columns are the average ratings out of 5, and they look small next to it, but their exact values are given in Table 3 above. If we compare only those five, the bars are almost the same height, and the last one, Recognition (3.83), is the lowest of all. The gap is not huge, but it is the only factor which falls below 4, and as we will see in the next sections, it is a weak point in several departments.

In the future I would keep the total number of employees out of this chart, so that the ratings are easier to compare. For this report, the exact values of the five ratings are given in Table 3, so nothing is missed.

6. Company Recommendation Analysis

The last question in the survey asked whether the employee would recommend the company to others. This is a very useful question because it shows the overall feeling of the employee in one answer, instead of just one particular factor.

Chart 2: Employee Company Recommendation (from my Excel sheet)

Out of 30 employees, 24 said Yes and 6 said No. This means 80% of the employees would recommend the company, while 20% would not. An 80% result is a good figure, and it shows that most of the workforce is positive about the company.

However, 6 employees is still one out of every five. I wanted to know where these 6 people come from, so I counted the answers department-wise.

Department	Yes	No	% Yes
IT	7	0	100%
HR	5	0	100%
Sales	7	2	78%
Marketing	4	1	80%
Finance	1	3	25%

Table 4: Recommendation answers by department

This result is quite clear. IT and HR are fully positive, with every employee saying Yes. The problem is concentrated in Finance, where three out of four employees said No. Sales has two No answers and Marketing has one. So half of all the No answers (3 out of 6) are coming from Finance, even though it is the smallest department.

7. Department-wise Analysis

The pivot table in Excel was used to find the average of each factor for every department. The values are shown below, rounded to two decimal places.

Department	Salary	Work-Life	Mgmt Support	Career	Recognition
Finance	3.25	3.75	3.75	4.25	3.50
HR	4.40	4.00	4.60	3.80	3.80
IT	4.29	4.29	4.00	4.57	4.29
Marketing	4.00	3.40	3.20	3.60	3.00
Sales	4.11	4.44	4.56	3.89	4.11
All employees	4.07	4.07	4.10	4.03	3.83

Table 5: Average scores by department (pivot table output)

Row Labels	Average of Career Growth	Average of Recognition	Count of Employee ID	Average of Management Support	Average of Work-Life Balance	Average of Salary Satisfaction
Finance	4.25	3.5	4	3.75	3.75	3.25
HR	3.8	3.8	5	4.6	4	4.4
IT	4.571428571	4.285714286	7	4	4.285714286	4.285714286
Marketing	3.6	3	5	3.2	3.4	4
Sales	3.888888889	4.111111111	9	4.555555556	4.444444444	4.111111111
Grand Total	**4.03**	**3.83**	**30**	**4.1**	**4.07**	**4.07**

Figure 1: Pivot table of department-wise averages (from my Excel sheet)

7.1 What each department shows

IT: This is the best performing department. It has the highest career growth (4.57) and good scores in the other factors too, and all 7 employees would recommend the company.

HR: HR has the highest salary satisfaction (4.40) and management support (4.60). Its career growth and recognition scores (3.80 each) are lower than the rest of its ratings, so there is some room to improve.

Sales: Sales is the largest group. Work-life balance (4.44) and management support (4.56) are very good. The two No answers from this department are something to look into, since its scores do not explain them clearly.

Marketing: Marketing has the lowest score in four out of five factors. Management support is 3.20, work-life balance is 3.40, and recognition is only 3.00, which is the lowest single value in the whole table.

Finance: Finance has the lowest salary satisfaction (3.25), and its recognition (3.50), work-life balance and management support (both 3.75) are also low. Its career growth score of 4.25 is quite high, so the employees seem to like the growth chances but not the pay and the support they get.

8. Key Findings

After going through the summary sheet, the pivot table and the charts, these are the main points I found:

- **Overall satisfaction is good.** All factors average above 3.8 and four of the five are above 4.0.
- **Recognition is the weakest factor overall.** At 3.83 it is the lowest average, and in Marketing it falls to 3.00.
- **80% of employees would recommend the company.** 24 said Yes and 6 said No.
- **Marketing needs the most attention on the factors.** It has the lowest scores for management support, work-life balance, career growth and recognition.
- **Finance is the biggest worry for loyalty.** Only 1 of its 4 employees would recommend the company, and it also has the lowest salary satisfaction.
- **IT and HR are doing well.** Every employee in these two departments would recommend the company.
- **Strong management support in HR and Sales shows what is possible.** Their scores of 4.60 and 4.56 can be used as an example for the weaker departments.

Overall picture

The company is not in a bad position. Most people are satisfied and the main scores are healthy. But the overall average hides the differences between departments. If I had looked only at the overall averages, I would have thought everything was fine. It was the pivot table that showed that Marketing and Finance are quite different from the others. This is the reason why department-wise analysis is important in any survey.

9. Recommendations for Improving Employee Morale

Based on the findings, I am suggesting the following actions. I have tried to keep them practical, so that the management can actually start them without needing a very large budget.

9.1 Improve recognition across the company

- Start a simple monthly "Employee of the Month" or team appreciation programme, and let colleagues nominate each other as well as managers.

- Ask managers to give regular and specific feedback, such as a short thank-you note or a mention in the team meeting, when someone does good work.
- Add small rewards like certificates, gift vouchers or an extra day off for outstanding performance.

9.2 Support the Marketing department

- Hold a meeting between Marketing employees and their managers to understand why management support is rated only 3.20.
- Check the workload and deadlines of the team. A score of 3.40 for work-life balance suggests that employees may be working long hours, especially during campaigns.
- Provide training and a clear promotion path so that career growth (3.60) improves.

9.3 Deal with the problem in Finance

- Review the salary structure of the Finance team against the market. Salary satisfaction of 3.25 is the lowest in the company.
- Talk to the four employees (in a way that keeps their answers private) to find out why three of them would not recommend the company.
- Consider flexible timings or additional support during busy periods like the financial year end, because work-life balance and management support are both 3.75.

9.4 Learn from the strong departments

- HR and Sales have high management support scores. Their managers can share what they do with the managers of Marketing and Finance.
- IT has the best career growth score (4.57). The company can look at its training and learning opportunities and offer similar ones to other departments.

9.5 Keep measuring

- Repeat the survey every six months with the same questions, so the company can check whether the changes are working.
- Add a comment box for open-ended answers. Numbers show what the problem is, but written comments can show why.

10. Limitations and Conclusion

10.1 Limitations

There are some limits to this study which I should mention. First, the sample is small, only 30 employees, and some departments have just 4 or 5 people, so the averages can change a lot with one different answer. Second, the survey uses only ratings and a yes or no question, which cannot explain the reasons behind the scores. Third, the survey was taken once, so I cannot say whether the situation is getting better or worse over time. Because of this, the results should be treated as a guide and not as final proof.

10.2 Conclusion

In this project I analysed an employee satisfaction survey of 30 employees from five departments using Word, Excel and PowerPoint. The results show that the company is doing fairly well overall. All the satisfaction factors scored above 3.8 out of 5, and 80% of the employees would recommend the company.

Still, a closer look found areas which need attention. Recognition is the lowest rated factor overall. Marketing has low scores in most factors, and Finance has low salary satisfaction and a very low recommendation rate. If the management works on recognition, listens to these two departments and repeats the survey regularly, I believe employee morale can improve further.

Doing this project taught me how to organise raw data, use formulas and pivot tables, create charts, and explain the results in simple words. It also showed me that numbers alone are not enough, and that they have to be read carefully to understand what is really happening.
